

MAYTAG INSTALLATION INSTRUCTIONS

REPAIR PART NO.: 9-1862

DESCRIPTION: **AUXILIARY DOOR SPRING KIT**

A dishwasher door has two main springs plus a booster spring on the right-hand side. If an extremely heavy sculptured door panel is used it may be desirable to install a booster spring on the left hinge.

To Install

1. Place grommet on rounded spring hook and insert into the door hinge.
2. Install remaining spring hook into mounting bracket. **NOTE:** The spring hooks must point inward at the bottom and outward at the top.

Door Spring Adjustment

The main springs would normally be in the first hole of the spring bracket. (One of the functions of the main springs is to hold the door closed at the top). The booster spring can be adjusted to balance the door. Moving the booster spring to the rear will slow the opening (decreasing door bounce) and improve on balance. In some situations you may find it desirable to move the main springs back a hole or two in the spring bracket.
